Iagon Brandbook Package

Brand Strategy

Vision · The world we're building toward

A world built on self-sovereign data, where every person, business, and institution controls what's theirs, by design.

Our Vision is not a description of our product - it's a description of the world our product makes possible. Data is the substrate of modern life: our health, our finances, our work, our identity, our institutions. Today, most of that data lives on infrastructure we neither own nor govern. We believe that is a historical accident, not a permanent condition. Self-sovereign data is the property a world has when its people, companies, and institutions can control what's theirs - not by permission, not by process, but by the architecture of the systems they rely on. That is the world Iagon exists to build.

Mission · How we get there

We're building the Shared Storage and Compute Economy: a global, decentralized infrastructure layer where data ownership, compliance, and control belong to the people who create the data, not the platforms that store it.

Our mission names the category we're creating: the Shared Storage and Compute Economy. It's an economy because it turns the world's idle digital resources into shared infrastructure. A large share of global storage and compute capacity sits unused at any moment. That capacity already exists, already consumes power, and already sits in data centres and offices around the

world. We turn it into infrastructure someone needs. It's decentralized because no single entity should control the data of billions. And it's compliant by design because privacy, sovereignty, and regulation are not features we add - they're the foundation we build on.

How to use Vision & Mission

- ✅ **Use the Vision** when speaking to the world: keynotes, manifestos, campaign headlines, investor decks, op-eds, community moments.
- ✅ **Use the Mission** when speaking to buyers and partners: sales decks, product pages, partnership briefs, enterprise RFPs.
- ✅ **Always pair the two** when introducing lagon for the first time. Vision without Mission sounds abstract. Mission without Vision sounds like just another vendor.
- ❌ **Don't shorten the Vision** to fit a tagline. It's a strategic document, not a marketing line - the tagline lives in the Message Box
- ❌ **Don't swap "people, businesses, institutions"** for a single audience. The universality is the point - lagon serves all three.
- ❌ **Don't describe lagon as "a company that offers cloud storage"** in official communication. We're the infrastructure layer for the Shared Storage and Compute Economy.

The Compliance Gap · The problem we exist to close

Regulation is clear about what it wants. Sensitive data stays under the owner's control, inside agreed jurisdictions, with every access accounted for. The infrastructure most organizations rent cannot do any of that structurally.

So the gap gets filled by other means. Process. Paperwork. Certifications. Contractual assurances. Audits that describe what should happen rather than enforce it. The work is real, the cost is permanent, and **the gap never fully closes, because the architecture underneath it never changed**.

We call this the Compliance Gap. Naming it matters. It is the problem our

category exists to solve, and it is the first thing we explain in any serious conversation.

lagon closes the gap in the architecture. **Compliance conditions are set by the customer and enforced by the network before data is placed anywhere.** That is the difference between compliance by process and compliance by design.

DNA Anchors · What we say

Three phrases that carry the load of everything lagon communicates. They earn a place in headlines, keynotes, pitch closings, and investor decks. Every piece of external language should ladder up to at least one of them.

Emotional Anchor	Rational Anchor	Strategic Anchor
Your data, your control, your future.	**Compliance by design, not by process.**	**Designed for Enterprise, Built for Everyone.**
The line we leave people with. Use at the end of manifestos, campaigns, keynotes.	*The line that wins enterprise trust. Use in sales decks, product pages, regulatory briefs.*	*The line that names our market position. Use in partnership briefs, presentations, category-defining moments.*
Why it's true	Why it's true	Why it's true
Sovereignty first. We give users control even when it is harder to build. See Core Values.	Compliance conditions are enforced by the network before data is placed. See The Compliance Gap.	We build for the customers with the strictest requirements. See the Lighthouse Principle.

DNA anchors are **what we say.** Core values are **how we earn the right to say it.**

Core Values · How we work

Five principles that govern how we make decisions, build products, hire, and serve customers. Every value is tied to the DNA anchor it proves. If a decision doesn't honor these, we don't make it.

Sovereignty first

Proves emotional anchor

We default to giving users control, even when it's harder to build. Sovereignty is not a feature we add - it's the constraint we design against from day one.

In practice	When engineering must choose between a faster centralized shortcut and a slower sovereign path - we take the sovereign path.
We reject	Dark patterns, opaque terms of service, convenience-for-control trade-offs, and lock-in architectures.

Build it right, not fast

Proves rational anchor

We'd rather ship later than ship compromised. In infrastructure, shortcuts become tomorrow's breaches. Our customers' data is mission-critical - our standard must match the stakes.

In practice	Security audits, patent protection, peer-reviewed architecture - before launch, not after. No "ship now, harden later."
We reject	Move-fast-and-break-things philosophy. That belongs to social apps, not banking infrastructure.

Earn the hard customer

Proves strategic anchor

We optimize for the customer with the highest standards - banks, healthcare, regulated enterprise. If we can serve them, we can serve anyone. This is why we're Designed for Enterprise, Built for Everyone.

In practice	Product roadmap is driven by Fortune 500 and regulated industry requirements first. Consumer ease comes from clearing the higher bar.
We reject	Lowest-common-denominator design. Features that would never pass a compliance review.

Verifiable by design

Proves rational anchor

Trust in infrastructure is not claimed - it's demonstrated. We publish what proves the system works: patents, audits, on-chain economics, governance, and architectural reviews. What we protect - we protect openly, and explain why.

What we publish	Patent filings in 15+ jurisdictions. Independent security audits. On-chain treasury and token flows. Governance decisions. Partnership structures, architecture research. All network figures are maintained in the Ecosystem Stats App and published with a date. See A note on figures at the end of this section.
What we protect	The patented core architecture - legally, to protect the ecosystem from replication. Enterprise deployments - contractually, to honor our customers' compliance and confidentiality requirements.
We reject	Marketing claims we can't back with evidence, audits, or code. "Trust us" as an answer. Hidden governance. Undisclosed economic interests.
lagon is not open-source by default - it is verifiable by default. These are different things, and the distinction matters. Open-source assumes code visibility equals trust. Verifiable means we provide the evidence that lets any stakeholder - regulator, customer, investor, community - independently confirm we do what we say. Patents make our core defensible. Audits make it credible. On-chain economics make it auditable. Together, they build a trust model stronger than open-source alone.	

Own the outcome

Proves rational anchor

Every team member is accountable for what the customer experiences - not just their slice of the stack. Decentralized architecture demands distributed ownership of results.

In practice	If a partner's pilot fails, everyone involved owns that failure. If compliance breaks, it's not "legal's problem" - it's the company's.

We reject	Silo thinking. "Not my team" deflections. Handoffs without follow-through.

How to use this system	
For marketers	Every piece of external content should visibly ladder up to at least one DNA anchor. If you can't name the anchor a headline serves, rewrite it.
For product	Feature proposals must pass at least one core value test. If a feature violates "Sovereignty first" - it doesn't ship, regardless of demand.
For hiring	Interview for values alignment, not just skills. Candidates who don't understand "Build it right, not fast" won't survive the culture.
For sales	Lead enterprise conversations with DNA rational core. Lead community conversations with DNA emotional core. Both sides honor the same values.
For leadership	When two values conflict in a decision - document the trade-off openly. Values tension is the sign of a real system, not a broken one.

Brand Purpose · Why we exist

We exist to give people, businesses, and institutions the right to own what's theirs.

Data is the defining asset of modern life - it contains our health, our money, our identity, our work. Yet most of that data is owned by the platforms that store it, not the people who create it. Iagon exists to reverse that imbalance. Our purpose is not to build a cloud product - our purpose is to restore a right that was quietly taken. Everything we make is a means to that end.

Brand Promise · What we deliver, every time

Enterprise-grade cloud services with compliance, sovereignty, and security built into the architecture. Not bolted on after.

When a customer chooses Iagon, they are not choosing a "decentralized alternative" to traditional cloud. They are choosing infrastructure where the things they used to fight for - regulatory compliance, data sovereignty, security - are structural properties of the system itself. No retrofitting. No compliance theatre. No security-as-a-service add-ons. The architecture does the work, every deployment, every region, every time.

Why Purpose + Promise work together

Purpose is a **manifesto**. Promise is a **contract**. Purpose earns belief from people who don't yet need us. Promise earns trust from people who are about to choose us. Great brands carry both - and know which to lead with for which audience. Lead with Purpose for community, press, regulators, and talent. Lead with Promise for buyers, partners, and analysts. Both must be true at the same time, or neither is real.

Brand Narrative · Story Behind

The canonical story. Short and core versions below are derived from it and must not contradict it.

Core Version (~300 words)

In 2017, four PhDs asked a question that most cloud companies never get around to: who actually owns the data that defines your life?

The question came from healthcare. Medical records - the most intimate data a person generates - were stored on infrastructure patients didn't control, couldn't audit, and often couldn't access. The data was about the patient, but it was never theirs. The founders of Iagon - a medical entrepreneur, an ex-Huawei

CTO with 12 patents, an ex-Expedia and ex-Google engineering leader, and an AI economist - recognized this wasn't a healthcare problem. It was the defining problem of the cloud era.

So they began building the infrastructure that could fix it.
Seven years later, Iagon is the patented architecture behind the Shared Storage and Compute Economy - a global, decentralized network where data ownership, compliance, and control belong to the people who create the data, not the platforms that store it. Our technology is protected in 15+ jurisdictions, security-reviewed and audited across key components, and lives on Cardano - a blockchain built for systems that must operate for decades.

Today, Iagon is being adopted and validated across enterprise environments - from global banks and industrial manufacturers to healthcare and digital asset infrastructure providers. Fireblocks relies on our Iagon Insight API to connect 2,400+ institutions to Cardano. Würth Group secures its 3D printing IP on our network. Volksbank builds user-owned data vaults on our architecture.

Designed for Enterprise. Built for Everyone. Because the right to own your data doesn't belong to the few - it belongs to anyone who has data worth protecting.

Your data, your control, your future.

Short version (~60 words)

In 2017, four PhDs asked who actually owns the data that defines your life. The question came from healthcare. The answer became Iagon, the patented architecture behind the Shared Storage and Compute Economy, where data ownership, compliance, and control belong to the people who create the data, not the platforms that store it. Designed for Enterprise. Built for Everyone.

Where each version goes

One story, three lengths. The core version is the source of truth. The short and core versions are derived from it and must never contradict it.

Short ~60 words	Social bios, website hero subtext, email signatures, conference programmes, and quick introductions at partner meetings. Anywhere the reader gives us fifteen seconds.
Core ~300 words	About page, press kit, investor one-pager, partnership briefs, and spokesperson preparation before interviews. This is the version journalists quote, so it should be easy to copy and easy to lift a paragraph from.

Rule:

Short is not a trimmed Core is not a padded Core. Each version is written for its own surface and its own reader. What stays identical across all three is the opening question, the healthcare origin, the category name, and the closing line.

Longer formats. Founder's letters, annual recaps, careers pages, and keynote scripts are built from the Core version when the moment calls for them. They expand the same story, they never replace it. Anyone writing one starts from the Core version and adds detail, not a different narrative.

Brand Archetype · How Iagon Plays in The Minds

The psychological role Iagon plays in the minds of its audiences. This is the single source of truth for every creative decision - voice, visuals, content, hiring, storytelling.

The 12 classical archetypes

Hero	Outlaw	Magician	Explorer
Lover	Jester	Innocent	Everyman
Creator	**Caregiver**	**Sage**	Ruler

The Sage with the soul of the Caregiver

Iagon speaks like a Sage and acts like a Caregiver. We earn authority through rigor, evidence, and intellectual seriousness - the way a scientist, a trusted doctor, or a top-tier research institution earns it. But the reason we do any of it is protective: we stand between people, businesses, and institutions and the loss of control over what's theirs. **Sage is our voice. Caregiver is our motive.** The combination is rare - and it is what makes Iagon possible.

The Sage

How we speak, present, and prove

The Sage believes the world improves through understanding. Sages are trusted because they demonstrate, not declare. Rigor over volume. Evidence over claim.

Desire	Truth, understanding, proof
Fear	Being wrong, being deceived, ignorance
Strategy	Research, analyze, publish, teach
Gift	Wisdom, perspective, credibility

The Caregiver

Why we build and for whom

The Caregiver exists to protect what matters. They stand between their people and risk. Protection by building, not posturing.

Desire	To protect, to serve, to defend
Fear	Failure to protect, harm done to those in their care
Strategy	Build defenses, create safety, anticipate risk
Gift	Safety, trust, sovereignty

Voice dimensions

Each dimension of voice is tuned to the Sage–Caregiver combination. **Sage calibrates the register; Caregiver calibrates the temperature.**

Dimension	Where	Why
Register	Intellectually serious, not academic	We speak with expertise but never condescend. A researcher explaining to a

		colleague, not a professor to a student.
Tone	Warm precision	Caregiver brings humanity to Sage's rigor. "We built this because we know what happens when you can't access your own medical record," - not "Feature enabled for HIPAA compliance."
Energy	Calm and steady	Sage-Caregiver brands do not raise their voice. Authority is earned through composure. No hype, no urgency theatre.
Vocabulary	Precise, evidence-led, human	Prefer specific over abstract. "823 nodes in 56 countries" over "global network." "Healthcare records" over "sensitive data."
Humor	Dry, restrained, rare	Sage humor works. Jester humor does not. If in doubt, leave it out.
Authority	Show, don't assert	"15+ patent jurisdictions" earns authority. "We are the leader in..." does not.

Voice in practice - examples

Sage-Caregiver voice (correct)

"Medical records are the most intimate data a person generates. They sat on infrastructure patients didn't control and often couldn't access. We built lagon to change that - for them, and for everyone whose data is owned by someone else."

Pure Sage (too cold - Caregiver missing)

"lagon provides a patented decentralized architecture for healthcare data management, meeting HIPAA and GDPR compliance standards across 15+ jurisdictions."

Pure Caregiver (too soft - Sage missing)

"Your medical data is precious. We care about keeping it safe for you. With lagon, you and your family can feel confident your information is in good hands."

Content Implications

Content we make	Content we avoid

Research papers & whitepapers. Long-form, evidence-led, technical where needed.	**Hype posts, hot-takes, reaction content.** Sage-Caregiver does not chase timelines.
Case studies with named outcomes. How Würth secured 3D printing IP. What Volksbank's data vaults achieve.	**Meme marketing, crypto-Twitter banter.** We are infrastructure, not entertainment.
Explainers that teach. "What self-sovereign data actually means." "Why compliance-by-design is different."	**Celebrity endorsements, influencer campaigns.** Authority comes from evidence, not fame.
Human stories behind infrastructure. Why a patient in 2017 couldn't access their records. The people the technology protects.	**"Disruption" and "revolution" language.** Rulers disrupt. Sages explain. Caregivers protect.
Peer-reviewed architectural content. Audit reports, protocol deep-dives, patent explanations.	**Urgency marketing, FOMO, scarcity plays.** The Sage has no need to rush; the Caregiver never manipulates.
Testimony-style content. Interviews with CTOs, compliance officers, researchers - not influencers.	**Generic "thought leadership" on trending topics.** We write about what we know, deeply. Not what's in the news, thinly.

Visual Implications

Visuals are not a separate decision - they flow directly from the archetype. Sage visuals signal credibility and depth; Caregiver visuals signal humanity and warmth. lagon's visuals carry both.

Visuals to lead with	Visuals to avoid
Real people in professional environments. Doctors, engineers, compliance officers, bankers - in context, at work.	**Generic "futuristic" 3D renders.** Glowing cubes, hexagonal grids, matrix-style code. Visual cliché of everyone else.
Architectural and system diagrams. Clean, accurate, technical. A visible proof of rigor.	**Stock photos of abstract "tech."** Close-ups of circuit boards, anonymous hands on keyboards. Absence of humanity.
Document-like editorial layouts.	**Aggressive gradients, glowing effects, "cyberpunk" aesthetics.**

Think The Economist, Stripe documentation, IBM Research. Content-first, restrained, substantive.

Muted, credible color palette.
Deep blues, quiet purples, warm neutrals. Never neon, never "Web3 gradient overload."

Quality typography with clear hierarchy.
A serif for Sage authority (headlines, longform). A clean sans-serif for Caregiver accessibility (UI, product).

Generous whitespace.
Space around content signals confidence. Clutter signals anxiety.

Data visualized beautifully.
Charts, patents map, node distribution. Evidence presented with care.

These belong to the crypto-project visual culture we're outgrowing.

Meme-style graphics, cartoons, emoji-heavy design.
Belongs to the Jester archetype.

Fake diversity stock photography.
Caregiver values authenticity. Use real people wherever possible.

Mascot and character illustration in enterprise contexts.
The astronaut belongs to the Explorer and Jester archetypes, not to Sage-Caregiver. It stays available for community channels, merchandise, ecosystem content, and Cardano-native moments. It does not appear in enterprise, banking, healthcare, investor, or regulatory materials.

Storytelling Implications

Every brand tells the same handful of stories over and over.

Stories we tell

The hidden problem revealed.
"What we discovered about [data ownership in X industry]." Sage frame - revealing truth.

The person behind the infrastructure.
"A patient. A surgeon. A bank customer. A 3D printing engineer." Caregiver frame - who we protect.

The proof in the work.
"How Würth validates 3D printing IP with Iagon." "What our audit found." Sage frame - evidence.

The principle held.
"Why we chose a harder path." "What we refused to compromise on." Caregiver frame - integrity.

Stories we avoid

The rebellion against the establishment.
Outlaw archetype. We replace the system, we don't fight it.

The magical transformation story.
Magician archetype. We don't transform people - we protect what's already theirs.

The heroic founder story.
Hero archetype. Our founders are researchers and engineers, not champions. We tell the story of the problem and the people it affects, not the story of the people who solved it.

Inspiration/Diverge from Brands

Learn from	Diverge from
Stripe Sage at its best. Intellectual rigor, beautiful documentation, restraint. No hype, no influencers - just precision and proof. Iagon's content should aspire to this standard.	**Filecoin / Storj marketing** Generic Web3 Explorer voice - "frontiers," "new worlds," crypto-native aesthetics. Iagon is not an explorer; we are a Sage-Caregiver infrastructure company.
Cloudflare Sage with a mission. Technical authority + strong stance on an open internet. Shows how infrastructure brands can hold values without becoming activists.	**Oracle** Pure Ruler. Cold, institutional, authority-by-decree. We want enterprise credibility without the distance.
Volvo Caregiver at the enterprise level. Safety as a brand DNA, proven through engineering. Shows how protection can be premium, not patronizing.	**Consumer crypto brands (Coinbase, etc.)** Hero-Everyman voice. Democratization narrative, approachability at the cost of rigor. We are more serious than that.
The Economist Sage voice on editorial. Calm, intelligent, evidence-first. Tone model for Iagon's longform content.	**AWS / Azure / GCP** Generic enterprise tech voice. Features-first, humanity-absent. Iagon's Caregiver soul is our differentiator - don't mute it.

The One-sentence Archetype Test

Before publishing any piece of content, running any campaign, approving any visual, or writing any copy - ask:

"Does this sound like a trusted expert who cares about the people on the other side?"

If yes, it's Sage-Caregiver. If it sounds like a salesman, it's wrong. If it sounds like an academic, add warmth. If it sounds like a cheerleader, add rigor. This single test replaces a hundred brand guidelines.

Strategic Positioning · Internal Direction Use

The single document that answers: who Iagon is for, in what category we play, why we win, and what we are willing to not be in order to win.

ℹ️

For the team - read this first

A Strategic Positioning Statement is the most misunderstood document in branding. People read it for the first time and assume it's a tagline, a slogan, or a marketing message. It is none of those. **It is an internal contract that disciplines every decision we make about how we go to market.** It is meant to be read by us, not by customers - and yet, every customer-facing decision flows from it.

Three distinctions are worth memorizing before you read further.

Tagline	A public weapon. **"Just Do It."** Designed to be quoted. Lives on billboards, in ads. External.
Marketing message	A campaign-specific phrase tuned to one audience and moment. Rotates with seasons and goals.
Positioning statement	An *internal compass*. Lives in the brandbook, in sales playbooks, in onboarding. Never shown to customers - but every customer interaction reflects it. Internal.

What positioning is for

Positioning forces a single, painful choice: **who are we for, and what are we willing to give up to win them?** A great positioning statement is identifiable by what it excludes, not just what it includes. If your positioning sounds like it's for everyone, it's positioning for no one.

This is not the same as saying "we only sell to one type of customer." Iagon's product is available to anyone - from Fortune 500 enterprises to individual users. **Positioning is about who we communicate to first and most clearly. The other audiences hear us through that signal.**

The Framework
Geoffrey Moore - "Crossing the Chasm" (1991)

Moore's positioning framework is the standard used by most billion-dollar B2B and infrastructure brands of the last 30 years - Salesforce, Stripe, Snowflake, Datadog, Atlassian. The framework is a single sentence with seven mandatory components. Each component answers a specific strategic question. *If even one component is missing or vague, the positioning is broken.*

For [target customer] **Who** [statement of need or opportunity] **The** [product/category name] **Is** [product category] **That** [statement of key benefit / compelling reason to buy] **Unlike** [primary competitive alternative] **Our product** [statement of primary differentiation]

Iagon's Statement

For	**regulated industries** where data sovereignty and compliance are mission-critical
Who	need to store and process sensitive data without sacrificing privacy, control, or auditability
Iagon	is the **compliance-first cloud infrastructure of the Shared Storage and Compute Economy**
That	turns regulatory requirements into structural properties of the system, closing the gap between what regulation demands and what infrastructure delivers.
Unlike	traditional cloud providers that retrofit compliance through processes and certifications
Iagon	is the only architecture with granted patents in 15+ jurisdictions built specifically for regulated environments, validated by deployments in banking, healthcare, legal, manufacturing, and digital asset infrastructure, running on a distributed network that spans 50+ countries.

Read as a single sentence

For **regulated industries** where data sovereignty and compliance are mission-critical, who need to store and process sensitive data without

sacrificing privacy, control, or auditability, Iagon is the **compliance-first cloud infrastructure of the Shared Storage and Compute Economy** that turns regulatory requirements into structural properties of the system - closing the gap between what regulation demands and what infrastructure delivers. Unlike traditional cloud providers that retrofit compliance through processes and certifications, Iagon is the only architecture with granted patents in 15+ jurisdictions built specifically for regulated environments, validated by deployments in banking, healthcare, legal, manufacturing, and digital asset infrastructure, running on a distributed network that spans 50+ countries.

Why "regulated industries" - not "everyone"

Iagon's product serves anyone with data worth protecting. But our **positioning concentrates communication on regulated industries** for three reasons.

First - proof. Our existing pilots (Volksbank, Würth, Cloud Court, Fortune 500, healthcare, Fireblocks) are concentrated there. Positioning has to reflect reality, not ambition.

Second - category ownership. "Compliance-first decentralized infrastructure" is an empty position in the market. AWS owns "enterprise cloud." Filecoin owns "decentralized storage." Nobody owns the intersection - and Iagon has every asset needed to claim it.

Third - natural expansion. Win the hardest customers (banks, healthcare, legal) and every other audience downstream - Web2 enterprises, individual users, Web3 builders - receives a stronger trust signal than any "for everyone" positioning could ever generate.

The lighthouse principle - how every other audience receives this signal

A lighthouse points one strong beam in one direction. Ships approaching from any angle see that beam and orient toward it. **That's how positioning works.** We point our communication at regulated industries; everyone else hears that signal and reads it as an indicator of seriousness, rigor, and trust. This is the opposite of the "for everyone" trap - which produces a faint glow visible to nobody.

Fortune 500 enterprise CTOs	Hear: *"If they pass banking and healthcare compliance, they'll pass our procurement."* **Trust accelerates.**
Web2 SMBs and SaaS companies	Hear: *"If banks trust this infrastructure, it's overkill for what we need - which is exactly what we want."* = **Confidence to adopt.**
Individual / retail users	Hear: *"If hospitals and banks trust this, my data is safer here than anywhere else."* **Premium trust signal.**
Web3 / Cardano builders	Hear: *"Built on serious infrastructure used by 2,400+ institutions through Fireblocks."* **Credibility for their own users.**
Investors and analysts	Hear: *"Concentrated positioning in a regulated, high-margin segment - disciplined go-to-market."* **Stronger thesis.**

How to use the Strategic Positioning Statement

- ✅ **Use it as the source of truth in sales playbooks, RFPs, analyst briefings, investor materials.** The full statement appears in onboarding for every new commercial team member.
- ✅ **Use it as the test for new content.** Before any campaign or content piece, ask: does this clearly serve a regulated-industry buyer? If yes, ship. If only adjacent, route to community/dev channels.
- ✅ **Translate it for each audience**. The Message Box section will derive audience-specific messaging from this statement. The statement itself stays constant; the translations vary.
- ❌ **Don't publish this statement on the website or marketing materials.** It's an internal compass, not a public message. The public sees its translations - never the statement itself.
- ❌ **Don't broaden it to "all enterprise" or "all data-sensitive use cases."** Each broadening dilutes it. Re-read "Why regulated industries, not everyone" if tempted.
- ❌ **Don't change it to fit a campaign.** Campaigns adapt to positioning, not the other way around. Positioning is reviewed annually, not quarterly.

A note on figures

Network metrics change continuously. Node count, storage capacity, countries, cities, and staked IAG are different every epoch. They are maintained in the Ecosystem Stats App, updated quarterly, and every other document references that sheet instead of hard-coding numbers.

Where a figure appears in a published material, it carries the line "figures as of [Day Month Year]". A number without a date is a claim we cannot stand behind, and standing behind our claims is the whole point of Verifiable by design.

This rule applies to every section of this package, including Messaging, Tone of Voice, Market and Audience, and all Activation Playbooks.

Messaging System

Three Frames · How every lagon conversation is built

Every conversation about lagon answers three questions, in this order: what is broken, what we built, and who it is for.

These are not three topics to choose from. There are three steps, and the order is the point. A listener who has not seen the problem has no reason to care about the category. A listener who does not understand the category cannot place us against anything they already know. And a listener who understands both will still walk away unless someone tells them whether this is meant for them.

Everything below the frames works inside this order. The frames set the sequence. The pillars carry the proof.

FRAME 1 · WHAT IS BROKEN

The Compliance Gap

Regulation is clear about what it wants. Sensitive data stays under the owner's control, inside agreed jurisdictions, with every access accounted for. Rented infrastructure cannot do any of that structurally. So the gap gets filled by process, paperwork, and audits that describe what should happen rather than enforce it. The work is real, the cost is permanent, and the gap never fully closes.

Role: opens the conversation. Earns us the right to speak.

FRAME 2 · WHAT WE BUILT

The Shared Storage and Compute Economy

A marketplace for storage and compute. The buyer gets infrastructure. The owner of idle capacity earns from it. The compliance rules are enforced by the network, not by the contract on top of it.

Role: explains the model. Names the category.

FRAME 3 · WHO IT IS FOR

Designed for Enterprise, Built for Everyone

We build for the customer with the strictest requirements: a bank, a hospital, a law firm, a manufacturer. The bar they set stays the same for everyone else. That is why the same infrastructure serves a Fortune 50 company and a single person.

Role: removes the question "is this for me". The public form of the lighthouse principle.

How to use The Frames

- ✅ Open with Frame 1 in any first conversation. Naming the problem is what lets us set the terms of comparison.
- ✅ Use Frame 2 alone when the listener already knows the problem. Customers, regulators, and analysts rarely need the gap explained twice.
- ✅ Use Frame 3 whenever the audience is not a regulated enterprise. It tells an SMB, a developer, or a private user that they are not in the wrong room.
- ❌ Don't open with the category. A definition without a problem is something to evaluate, not something to care about.
- ❌ Don't use Frame 3 as a tagline. It is a positioning line: longer, more functional, and with a different job.
- ❌ Don't compress three frames into one sentence. If there is room for only one, use Frame 1 and stop.

Core Message · The argument every lagon message makes in its own words

This is not a tagline and not a published copy. It is the reasoning underneath every pitch, page, and deck. If a message cannot be traced back to it, the message is wrong.

The infrastructure most organizations rent cannot enforce the rules they are held to.	*Names the problem.* Structural, not anyone's fault.
So the gap is filled with process, paperwork, and certifications that describe what should happen.	*Names the workaround.* Recognisable to anyone who has lived it.
lagon closes the gap in the architecture. Compliance conditions are set by the customer and enforced by the network before data is placed anywhere.	*Names the shift.* Architecture instead of paperwork.

Why it is written this way

It starts with the gap, not the category

Whoever names the problem sets the terms of comparison. Open with the category and the listener decides for themselves what to compare us against, usually a storage provider. Open with the gap and the comparison happens on our ground.

It is written in the third person

The core has to be the most portable version, not the warmest one. A warm second-person form is easy to derive from an institutional one. The reverse does not work: no paragraph for an auditor can be derived from "your data, your rules".

It blames the architecture, not the customer

The compliance officer reading this built the process we are describing. The sentence has to say the workaround was necessary and expensive, not that it was a mistake. Caregiver protects, it does not accuse.

The word "before" carries the claim

Enforced before data is placed, not audited after. That single word is the difference between compliance by design and compliance by process.
It never gets cut when the core is shortened.

How to use The Core Message

- ✅ Use it as the test. Read any draft next to it and ask whether the draft makes this argument. If it makes a different one, the draft is off-system.
- ✅ Use it in onboarding. Every commercial hire should be able to make this argument without notes in their first month.
- ✅ Rewrite it for the surface. The argument stays fixed. The words change for a deck, a landing page, a keynote, or an answer to a journalist.

❌ Don't publish it word for word. It reads as internal reasoning because that is what it is.

❌ Don't cut it to the third sentence. The solution without the gap is a product claim, and product claims invite feature comparison.

❌ Don't add the token, the network size, or the blockchain here. Proof belongs to the pillars. The core is the argument alone.

Message Box · The four things lagon can claim

Four pillars. Every external piece rests on at least one of them. If the pillar cannot be named, the piece gets rewritten.

A pillar is not a feature list and not a value proposition. It is a claim we are prepared to defend, paired with the kind of evidence that defends it and the line past which the claim stops being defensible.

Proof here is described by type, not by name. Named deployments, figures, and dates live in the Proof Library and are quoted from there. A pillar has to hold as a framework, independent of which logo is current.

[Pillar 01] Compliance is built in

Rational anchor

Regulatory requirements are enforced by the system, not documented by paperwork.

Proof	Compliance conditions configured per deployment. Data residency set by the customer and enforced by the network. Every access recorded. Granted patents in 15+ jurisdictions. Live deployments in banking, healthcare, and legal.
Lead with it	Enterprise buyers. Regulators. Compliance officers. RFPs. Analysts.
Never say	Fully compliant out of the box.

	Guarantees regulatory approval.

[Pillar 02] Data sovereignty by default

Emotional anchor

You decide where your data lives, who reaches it, and when access ends. Sovereignty is the default state, not a setting you configure.

Proof	Encryption keys held by the customer. Permissions granular and revocable. Consent-based access in regulated deployments. User-owned data vaults running in production. Industrial IP held and distributed under the owner's rules.
Lead with it	Community. Press. Retail users. Keynotes. Hiring.
Never say	Nobody can ever see your data. Total privacy. Your data can never be lost.

[Pillar 03] Security through architecture

Rational anchor

Data is encrypted, split, and distributed across the network. There is no single point of compromise by design.

Proof	Sharding and encryption at the protocol level. Storage distributed across a network spanning 50+ countries. Independent security reviews and audits of key components. Settlement on a public chain built for long-lived systems.
Lead with it	CTOs. Architects. Security teams. Technical press.
Never say	Impossible to breach. Unhackable. 100% secure. Eliminates the possibility of data leaks.

[Pillar 04] Proven where the bar is highest

Strategic anchor

Already running in the environments with the strictest requirements.

Proof	Live deployments in banking, healthcare, legal, industrial manufacturing, and digital asset infrastructure. Institutional-scale API integrations. National innovation funding. Independent audits. Founded by four PhDs.
Lead with it	Investors. Partners. SMBs. New markets. Any conversation short on trust.
Never say	Trusted by banks worldwide. The industry standard. Named customers without written approval.

How to use The Pillars

- ✅ Name the pillar before writing. Every brief starts with the pillar the piece serves, and every review checks it.
- ✅ Change the order for the audience. Which pillar leads is a decision. What the pillar claims is not.
- ✅ Pull named proof from the Proof Library. The pillar tells you what kind of evidence you need. The library tells you which one is current and cleared.
- ✅ Treat "never say" as binding. Each of those phrases is a claim we cannot defend, and several have been used about Iagon before.
- ❌ Don't use all four pillars in a short format. Four claims in one paragraph means none of them lands.
- ❌ Don't add a fifth pillar for a campaign. The campaign adapts to the system, not the other way around.
- ❌ Don't state a claim without proof nearby. A claim on its own is an assertion, and assertions are what our competitors make.

Audiences Variants · The same four pillars, spoken in seven registers

One audience receives the beam. Every other audience reads that beam as a signal about us. What changes is the order and the register. What never changes is the claim.

This is not a list of seven equal targets. Positioning concentrates our communication on regulated industries, and the rest of the market hears that concentration as evidence of seriousness. A page written for a bank tells an SMB more than a page written for an SMB ever could.

So the primary audience sets the standard. The downstream audiences are translations of it, not separate campaigns with separate promises.

PRIMARY AUDIENCE · THE BEAM

Regulated industries

Banking, healthcare, legal, industrial manufacturing, and digital asset infrastructure. The people who carry personal liability when data is handled wrongly.

They are asking	Will this survive our compliance review, and who carries the risk if it does not.
Pillar order	01 → 03 → 04 → 02
Register	Trusted by banks worldwide. The industry standard. Named customers without written approval.
Must hear	Your compliance conditions are set by you and enforced by the network before data is placed. Not described in a

	report afterwards.
Never	Price as the opening argument. The token. Decentralization presented as the reason to buy. The mascot.

Decentralization is how the promise is kept, not why anyone buys. For this audience it appears as an architectural fact inside [Pillar 03], never as a headline.

DOWNSTREAM AUDIENCES · THEY READ THE BEAM

Fortune 500 enterprise CTOs	
They are asking	Will this clear our procurement without becoming my problem.
Pillar order	04 → 01 → 03 → 02
Must hear	The architecture your procurement will assess is the one already cleared by banking and healthcare review.
Register	Brief and commercial. Precedent first, architecture second.
Never	Open with the blockchain. Lead with the category name.

Regulators and policy bodies	
They are asking	Does this serve what the regulation intended, or route around it.
Pillar order	01 → 03 → 04
Must hear	Conditions are enforced structurally and every access is accounted for. The evidence is published, with dates.
Register	Neutral and documentary. No marketing register at all.
Never	Superlatives. Any claim without a citable source. Framing regulation as an obstacle.

Investors and analysts	

They are asking	Is this a defensible position in a market worth owning.
Pillar order	04 → 01 → 02 → 03
Must hear	A patented position in a category nobody owns yet, concentrated on a regulated, high-margin segment.
Register	Category, defensibility, validation, discipline of focus.
Never	Token price. Roadmap dates as commitments. Market size without a named source.

Web2 SMBs and SaaS companies

They are asking	Is this too heavy for a team our size.
Pillar order	04 → 02 → 01
Must hear	Built to a standard set by banks and hospitals. You get that standard without building for it.
Register	Plain and short. The enterprise bar as reassurance, not as weight.
Never	Price as the opening argument. Consumer ease language. Full compliance depth they did not ask for.

Web3 and Cardano builders

They are asking	Can I build on this and will it still be here in five years.
Pillar order	03 → 04 → 02
Must hear	Institutional-grade storage and compute you can build on, running at institutional scale already.
Register	Technical and plain. Documentation tone. The mascot is allowed here.
Never	The token in the first line. Ecosystem hype. Comparisons framed as a fight.

Individual and retail users

They are asking	Why should I care where my data sits.
Pillar order	02 → 04 → 03
Must hear	Your data lives where you decide. It reaches only who you allow. Every access is recorded.
Register	Second person. Warm, concrete, one idea per sentence. The mascot is allowed here.
Never	Fear framing. Absolute safety promises. Jurisdiction and patent detail.

A DELIBERATE OMISSION · SUPPLY SIDE

Every audience above is on the demand side. The providers of idle storage and compute are not listed here, and that is a decision rather than an oversight.

Supply grows today through the network and the ecosystem, not through brand communication. A provider audience is added when supply becomes its own go to market line, with its own pillar order and its own register. Until then The Idle World narrative runs as an investor and partner story, and the word economy in our category name is carried by the model, not by a campaign.

How to use The Variants

- ✅ Pick one audience per piece. A page that answers two of these questions answers neither.
- ✅ Write the primary audience version first, then translate. Downstream versions are easier to derive from it than the other way around.
- ✅ Read the "must hear" line before writing and after. It is the one sentence the piece has to leave behind.
- ❌ Don't soften a claim for a downstream audience. Change the register and the order. Never the promise.
- ❌ Don't treat these seven as seven campaigns. They are translations of one position.

❌ Don't add an audience because a campaign needs one. Adding an audience is a positioning decision, reviewed annually.

Five narratives · The five stories lagon tells for years, in every format

A pillar tells you what we claim. A narrative tells you what we talk about. Without this block, every content plan starts from nothing.

Brands do not tell many stories. They tell a few, repeatedly, until the market can finish the sentence. Five is the working number: enough to cover every audience, few enough that each one accumulates weight instead of resetting each quarter.

Every narrative below carries one pillar or one frame, serves a defined audience, and has a line it must not cross. The line matters most. Each of these stories has a nearby version that belongs to an archetype we rejected.

[Narrative 01] Sage

The Compliance Gap

Regulation asks for one thing. Rented infrastructure can do another. The distance between them is paid for in process, every year, forever.

Shape	A reveal. Name the gap, show its cost, show that it is architectural and therefore closable.
Carries	Pillar 01 · Frame 1
For	Regulated industries. Regulators. Analysts.
Formats	Whitepapers. Explainers. RFP appendices. Conference talks. Opinion pieces.

Opens with	What regulation requires, and what rented infrastructure can structurally deliver. The distance between the two is the story.
Never becomes	An attack on cloud providers, or on regulation. Outlaw fights the system. We describe it and close the gap in it.

[Narrative 02] Caregiver

The Patient's File

The most intimate data a person generates sat on infrastructure they did not control and often could not reach. The file was about them. It was never theirs.

Shape	One person, one file, a system never built for them. The origin of the question, not the origin of the company.
Carries	Pillar 02 · Frame 1
For	Press. Community. Hiring. Keynotes.
Formats	About page. Keynote openings. Recruitment content. Interviews with clinicians and compliance officers.
Opens with	One person and one file. The data was about them and was never theirs.
Never becomes	The story of four founders who solved it. Hero archetype. The subject is the patient, not the people who noticed.

[Narrative 03] Sage

The Idle World

Storage and compute capacity is bought for peak demand and paid for at all times. Between the peaks it sits racked, powered, and doing nothing. Iagon turns that capacity into infrastructure someone needs.

Shape	Waste made visible, then put to work.

	An economic argument, not a moral one.
Carries	Frame 2 · No pillar of its own.
For	Investors. Partners. Analysts.
Formats	Investor materials. Partnership briefs. Category explainers. Economic deep dives.
Opens with	Capacity is bought for peak demand and paid for at all times. See the Proof Library for the sourced figure and how to cite it.
Never becomes	A yield story or a token story. The subject is capacity, not return.

[Narrative 04] Caregiver

The Hardest Customer

We build for the customer with the strictest requirements. Everyone else inherits that standard without asking for it.

Shape	A harder path chosen on purpose, and what choosing it cost us.
Carries	Pillar 04 · Frame 3
For	SMBs. Retail users. Builders. New markets. Hiring.
Formats	Blog. Engineering decisions. Careers page. The framing around every case study.
Opens with	A requirement we could have refused, and what building for it cost us.
Never becomes	A boast about which institutions use us. The subject is the standard, not the logo.

[Narrative 05] Sage

The Proof File

We publish what proves the system works, with dates.
We say plainly what we protect and why.

Shape	Continuous. Not a campaign but a habit. Each piece is small and dated.
Carries	Pillar 01 and Pillar 03
For	Every audience. The constant background.
Formats	Audit summaries. Patent explainers. Governance notes. On chain reports. Architecture posts.
Opens with	The artifact itself. An audit, a patent, a governance decision, dated.
Never becomes	A trust us claim with no artifact attached. If there is nothing to link to, there is nothing to publish.

Proof Library · Every name, number, and date the brand is allowed to use

One source for every claim. If a fact is not here, it does not go into external material until it is.

Pillars describe the kind of evidence a claim needs. This library supplies the specific one. Each entry carries a canonical phrasing, a source, a date, and a clearance status. Copy the phrasing rather than rewriting it, because a fact rewritten four times becomes four different facts.

Evidence is not all of one kind, and the differences matter. Some facts are permanent. Some expire. Some belong to a customer rather than to us.

Structural facts

Founding, patents, architecture, funding. They do not expire. They need a date only when the count can change, as with patent jurisdictions.

Network metrics

Nodes, countries, cities, capacity, staked IAG. They change every epoch. They live in the Iagon Ecosystem Stats App, are refreshed per epoch (~ weekly), and always publish with "figures as of [Day Month Year]".

Deployments

Named customers and pilots. These belong to the customer, not to us. Each one needs written clearance and an agreed description before it appears anywhere.

External research

Findings that are not ours. Always attributed to the author with the year of publication, never restated in the present tense as a current fact.

CLEARANCE STATUS

Cleared	Verified, dated, approved for any audience. Use the canonical phrasing as written.
Conditional	Usable inside stated limits only. The limit is written into the entry.
Pending	Not yet confirmed or not yet cleared by the customer. Does not appear in external material.

STRUCTURAL FACTS

Patent protection

Say	Granted patents in 15+ jurisdictions, covering the architecture rather than the idea.
Limit	Say granted, not filed or pending. Do not name individual jurisdictions without checking the current register.

Serves	Pillars 01 and 04

Founding

Say	Founded in 2017 by four PhDs. The question came from healthcare: patients did not control their own medical records.
Limit	Founder biographies are available but stay secondary. The subject is the problem, not the people who noticed it.
Serves	Pillar 04 · Narrative 02

Architecture

Say	Data is encrypted, sharded, and distributed. Keys stay with the customer. Compliance conditions are enforced by the network before data is placed. Built on Cardano, a public chain designed for systems that run for decades.
Limit	Cardano is an architectural fact, not an opening line in enterprise material. No absolute security claims in any wording.
Serves	Pillar 02 · Pillar 03

Security reviews and audits

Say	Independent security reviews and audits of key components.
Limit	Key components, not the whole system. Never say fully audited. Name the auditor and date only where the report is published.
Serves	Pillar 03 · Narrative 05

Network scale

Say	A distributed network spanning 50+ countries. Node count, cities, capacity, and staked IAG are quoted from the Ecosystem Stats App at the time of writing.
Limit	Never publish a figure without "figures as of [Day Month Year]". 50+ countries is the canonical geography figure.

	Staked IAG does not appear in enterprise, banking, healthcare, or regulatory material.
Serves	Pillar 03

Team

Cleared

Say	A team of 30+ working globally.
Limit	Refresh quarterly with the Ecosystem Stats App. Use in hiring and press, not as a proof point in enterprise material.
Serves	Narrative 02

RULE 1

Enterprise deployments

A customer's name is theirs, not ours. We describe a deployment only in words they have agreed to, and we describe exactly what it is.

Written clearance	No name appears in external material without written approval of the exact wording. Approval covers that wording, not the customer relationship in general.
Stage stays accurate	A pilot is called a pilot. An integration is called an integration. Production is called production only when it is.
One name is one name	A single bank never becomes "banks". A single manufacturer never becomes "industry". Plurals require plural evidence.
Their scale is theirs	A partner's customer count describes their reach, not our adoption. Never restate it as institutions using Iagon.
Unnamed still counts	Where a customer cannot be named, describe the category and the size precisely and leave it there. A precise unnamed customer is stronger than a vague named one.

Never	Logo walls without context. "Trusted by" formulations. A deployment described as a certification.

RULE 2

Industry facts

A finding someone else produced is quoted, not adopted. It carries its author and its year every time it appears.

Author and year	Named source, publication year, every time. A widely known number is still someone's research, and "the industry knows this" is not attribution.
Past tense	A study found. Not: the world currently has. Present tense turns a dated finding into a claim we cannot stand behind.
Scope stays intact	A sample is a sample. A region is a region. Never widen a finding to the world because the wider version reads better.
Supporting only	External findings sit inside the argument, never in a headline and never in a short format. Our arguments have to hold without them.
Age is disclosed	If the only available research is old, say so and use it anyway or drop it. Do not hide the year to make it sound current.
Never	Market size figures without a named source. Statistics quoted from another company's deck. Numbers that arrive without a link.

WHY THIS IS A BRAND RULE, NOT A LEGAL ONE

Verifiable by design is the value these rules serve. Legal exposure is the smaller risk. The larger one is that a Sage brand which overstates once is read differently forever, and no amount of accurate material afterwards fully undoes it. Precision here is not caution. It is the product.

Objection Handling · What to say when the system is tested

An objection is a question asked with the volume up. It gets an answer, not a defence. A Sage brand concedes what is true and answers what is not.

Every objection below has a real premise. Pretending otherwise is what makes an answer sound rehearsed. The pattern is the same each time: agree with what is accurate, correct what is not, point at the evidence, and stop.

Answers get shorter as they get better. If an answer needs three paragraphs, the objection has not been understood yet.

Enterprise · analysts

"Decentralized storage is not enterprise ready."

What is true	Most decentralized storage was built for a different buyer, with different assumptions about compliance and support.
Answer	Fair, and that is why we did not build a decentralized storage product. We built compliance-first infrastructure that happens to be distributed. The requirements came from banking, healthcare, and legal environments first. Decentralization is how the promise is kept, not the reason to buy.
Evidence	Live deployments in regulated sectors. Patented architecture in 15+ jurisdictions.
Never	Argue that decentralization is inherently better. That is the argument they already rejected.

Enterprise · compliance

"We already have compliance handled."

What is true	They do have it handled. Certifications are real, audits are real, and the work behind them is serious.
Answer	You do, and it costs you every year. The question is not whether you are compliant. It is how much of that compliance your infrastructure enforces and how much your people carry. We move part of that load into the architecture.
Evidence	Compliance conditions configured per deployment and enforced before data is placed.
Never	Suggest their current setup is inadequate. The person you are talking to built it.

Enterprise · CTOs · regulators

"Why is there a blockchain in this at all?"

What is true	Plenty of infrastructure has used a blockchain where it added nothing. The skepticism is earned.
Answer	It does one job: settlement and an access record nobody can quietly edit, including us. Your data is not on a chain. If that job could be done with a database we control, the record would be worth less, because you would be trusting us to keep it honest.
Evidence	Architecture documentation. Audited access records.
Never	Defend blockchain as a category, or avoid the word. Both read as evasion.

Enterprise · procurement

"Who is accountable when something goes wrong?"

What is true	Distributed systems raise a real question about where responsibility sits. It is the first thing procurement asks and the hardest to answer casually.
Answer	You contract with us and we are accountable to you. The network is how the service is delivered, not a way to spread the liability around. Access records are auditable, so the question of what happened has an answer rather than an

	opinion.
Evidence	Contract terms. Audited access records. Own the outcome as a stated company value.
Never	Describe accountability as shared by the network. That is the answer they are afraid of.

Enterprise · builders

"You are small. Will you be here in five years?"

What is true	We are small next to the providers they are comparing us to. Denying it costs more than admitting it.
Answer	We are, and it is a fair question to ask any infrastructure supplier. Three things answer it better than a promise: the architecture is patented, the network is distributed rather than dependent on our own data centres, and your keys are yours. What you build does not become unreachable if we are not the ones running it.
Evidence	Patents in 15+ jurisdictions. Distributed network across 50+ countries. Customer-held keys.
Never	Answer with growth projections or funding news. Neither is evidence of longevity.

Enterprise · SMB

"Migrating off our current provider is not realistic."

What is true	Full migration is expensive, slow, and rarely the right first move.
Answer	Nobody starts with migration. Start with the workload where sovereignty and compliance cost you the most. That is usually one dataset, one jurisdiction, one team. If it works there, the rest is a decision you make later with evidence.
Evidence	Existing deployments began as single-use-case pilots.
Never	Frame it as replacing their cloud. We are not asking them to leave anything.

Enterprise · regulators · press

"There is a token. Is this a crypto project?"

What is true	There is a token, and the question is asked because the sector has given people reasons to ask it.
Answer	It is how providers of capacity are paid in a network with no central operator. It is a settlement mechanism inside the system, not a product we sell you. Enterprise customers contract and pay in the ordinary way.
Evidence	On-chain economics published openly. Governance decisions on record.
Never	Downplay the token or change the subject. Answer plainly and move on.

How to use this block

- ✅ Concede first, every time. The concession is what makes the rest credible.
- ✅ Answer once and stop. Repeating an answer in different words reads as anxiety.
- ✅ Say when you do not know. Offer to come back with the answer, then come back with it.
- ❌ Don't win the argument. The goal is an accurate picture, not a defeated sceptic.
- ❌ Don't reach past the Never say limits under pressure. Objections are exactly where those limits get broken.
- ❌ Don't treat these as scripts. They are positions. The words are yours.

Tone of Voice · Who is speaking

Brand Personality · The character behind every sentence lagon writes

If lagon were a person in the room, this is who they would be. Writers do not write from an archetype. They write from a sense of who is talking.

Brand Strategy decided that lagon speaks like a Sage and acts like a Caregiver. That is a strategic choice. This block turns it into five traits, and every trait has to be visible in a single sentence. A trait you cannot see in a sentence is not a trait, it is a wish.

Five is the working number. A personality list nobody can hold while drafting does not shape any writing. If a sixth trait seems necessary, it usually belongs inside one of these.

Precise

Sage

We say specific thing. A number instead of an adjective, a named jurisdiction instead of "global", a named requirement instead of "compliance needs". Precision is not decoration. It is how a Sage earns the right to be believed.

Sounds like	Granted patents in 15+ jurisdictions.
Not like	Industry-leading patent protection.

Composed

Sage

We do not raise our voice. No urgency, no exclamation, no superlatives, no fear. The reader should feel that we would say the same thing tomorrow, in the same tone, whether or not they buy.

Sounds like	This runs in banking and healthcare environments today.

Not like	Don't get left behind. The cloud is broken. Act now.

Protective

Caregiver

We write from the side of the person whose data it is. Every explanation answers an unspoken question: what happens to what is mine. This is the trait most often lost when a text gets technical.

Sounds like	Your keys stay with you. Access ends when you end it.
Not like	Key management is handled client-side.

Respectful

Caregiver

We assume the reader is competent. We explain without condescending, and we never imply that their current setup was a mistake. The compliance officer reading us built the process we are describing.

Sounds like	You have compliance handled, and it costs you every year.
Not like	Most companies still rely on outdated manual processes.

Accountable

Core Value

We say what we can prove and name what we cannot. When we do not know, we say so. When something is a pilot, we call it a pilot. This trait is what makes the other four believable.

Sounds like	Independent security reviews of key components.
Not like	Fully audited and completely secure.

THE TRAIT WE LOSE FIRST

Under deadline, Precise and Composed survive. Protective is the one that quietly disappears, because it costs an extra sentence and does not feel load-bearing. A text with the first two and without the third is exactly the pure Sage example in Brand Strategy: accurate, calm, and cold. Check for the third trait last, when the draft already reads well. That is when it is missing.

We are, we are not · Five borders, each one a step away from a voice we could easily become

Every trait has a neighbour it turns into when pushed too far. The neighbour is never the opposite. It is the same trait with the brake released.

Brands rarely fail by becoming their opposite. They fail by overdoing what they are good at. Precision becomes jargon. Composure becomes coldness. Protection becomes pity. Each pair below marks the point where a strength stops working.

Read the right column as a warning, not as a description of someone else. Every one of these has appeared in our own drafts.

WE ARE **Precise**	WE ARE NOT Technical for its own sake
The slip	Detail added to sound credible rather than to be understood. The reader stops following and starts trusting on faith, which is the opposite of what precision is for.
The test	Would a competent reader outside our field follow this sentence? If not, the detail is decoration.

WE ARE **Composed**	WE ARE NOT Distant
The slip	Calm turns into indifference. The text stops sounding like someone who cares how this ends for the reader. This is the Oracle voice we named in Brand Strategy as one to diverge from.
The test	Is there a single sentence here written from the reader's side? If not, composure has become distant.

WE ARE **Protective**	WE ARE NOT Alarming
The slip	Protection is easiest to sell through fear, and fear is the fastest way to lose a Caregiver voice. A Caregiver never manipulates the people it protects.
The test	Does the text work if the reader is not worried? If it only works on a frightened reader, it is a fear play.

WE ARE **Respectful**	WE ARE NOT Deferential
The slip	Respect turns into hedging. Every claim gets softened until nothing is actually claimed. A Sage concedes what is true and then says the difficult thing plainly.
The test	Remove every qualifier. If nothing is left standing, there was no claim to begin with.

WE ARE **Accountable**	WE ARE NOT **Apologetic**
The slip	Naming a limit is not the same as apologising for it. A pilot called a pilot is a fact stated plainly, not a shortfall confessed.
The test	State the limit in one sentence and stop. If the next sentence explains why it is not so bad, that is an apology.

TWO BORDERS THAT MATTER MORE THAN THE REST

Composed becoming distant is the failure of an enterprise brand that gets serious about enterprise. It arrives slowly, one careful revision at a time, and nobody notices until the whole site reads like documentation for a machine.

Protective becoming alarming is the failure of a security brand under pressure to convert. It arrives fast, usually in a single campaign, and it is the harder one to undo.

Tone Spectrum · One voice, four settings, nothing switched off

Voice is who we are. Tone is how loudly each part of that shows in a given room. The character does not change between a regulatory filing and a community post. The proportions do.

A brand with one fixed tone is not disciplined, it is deaf. A regulator and a first-time user need different amounts of the same five traits. What would break the brand is not adjusting, it is adjusting past the borders in the previous block.

Four settings cover every surface we write for. Each one names what rises, what stays quiet, and what never moves.

Documentary

Coolest setting

Regulatory submissions. Audit summaries. RFP appendices. Technical documentation. The reader is assessing, not deciding, and any marketing register reads as a reason to distrust the document.

Rises	Precise. Accountable.
Quiet	Protective. It is present in what we chose to build, not in how we describe it.
Sounds like	Compliance conditions are set per deployment and enforced before data is placed. Access records are auditable. Figures as of March 2026.

Professional

Default setting

Website. Sales decks. Partner briefs. Investor materials. Most of what we publish lives here. The reader is deciding whether to spend time on us, and both rigor and warmth have to be visible in the same paragraph.

Rises	Precise. Respectful.
Quiet	Nothing. This is the balanced setting, and it is the hardest one to write.
Sounds like	You have compliance handled, and it costs you every year. The question is how much of it your infrastructure enforces and how much your people carry.

Personal

Warmest setting

Community channels. Keynote openings. Recruitment. Retail-facing pages. Press interviews about why we exist. Second person is allowed here and nowhere else.

Rises	Protective. Respectful.
Quiet	Precise stays, but in plain words. Jurisdiction counts and patent details come out.
Sounds like	Your data lives where you decide. It reaches only who you

	allow. Every access is recorded.

Under pressure

Hardest setting

Incidents. Delays. Hostile questions. Corrections. A public complaint. Nobody plans for this setting, which is why it has to be written down before it is needed.

Rises	Accountable. Composed.
Quiet	Everything persuasive. This is not the moment to explain why we are good.
Sounds like	Here is what happened, here is what we know so far, here is what we are doing, here is when we will update you next.

WHAT NEVER MOVES

The claims	A pillar says the same thing in every setting. Register changes, promise does not.
The limits	Never say holds in the warmest setting exactly as it holds in a filing. Warmth is not a licence to overstate.
Composure	No setting raises its voice. Personal is warm, not loud. Under pressure is calm, not defensive.
Dated figures	Every number carries its date, including in a social post and including out loud.

Tone of Voice · How we write

Writing Principles · Seven rules that operate at the level of the sentence

Personality decides who is speaking. These rules decide what the sentence looks like. Each one is checkable in seconds, which is the only kind of rule that survives a deadline.

[01] One idea per sentence

Split at the first "and" that joins two thoughts. Short sentences are not simpler, they are harder to hide behind.

❌	Iagon provides decentralized infrastructure that enables compliance while ensuring data sovereignty and delivering enterprise-grade security across jurisdictions.
✅	You set the compliance conditions. The network enforces them before data is placed.

[02] The specific beats the impressive

A number, a named sector, a named jurisdiction. Adjectives make a claim bigger and weaker at the same time.

❌	A vast global network with world-class security.

✅	Network distributed across 50+ countries. Independent audits of key components.

[03] Something does something

Name the actor and give them a verb. Passive voice and noun stacks hide who is responsible, which is the opposite of accountable.

❌	Rule enforcement capability is provided at the protocol layer.
✅	The network enforces the rules. You hold the keys.

[04] The verb matches the evidence

Enforces, reduces, removes, designed to. Never eliminates, guarantees, ensures. The verb is where a defensible claim becomes an indefensible one.

❌	Eliminating the possibility of data leaks.
✅	Designed so that no single point holds usable data.

[05] The claim carries its proof

Evidence sits in the same paragraph as the claim, not in a later section. A claim left alone is an assertion, and assertions are what our competitors make.

❌	Iagon is built for regulated environments.

✅	Iagon is built for regulated environments. It runs today in banking, healthcare, and legal deployments.

[06] Someone is on the other side

At least once in every piece, name the person the work protects. A patient, an engineer, a compliance officer. Without this the text is accurate and cold.

❌	Consent-based access control is available for healthcare deployments.
✅	The patient decides who opens the file, and every time it opens is recorded.

[07] Cut the throat-clearing

Delete the first sentence and check whether anything was lost. Openings that announce the topic instead of starting it are the most common waste in our drafts.

❌	In today's rapidly evolving digital landscape, data has become more important than ever.
✅	Regulation asks for three things. Rented infrastructure can enforce none of them.

THE ORDER MATTERS WHEN THEY CONFLICT

Rule 04 outranks everything. A shorter, warmer, more specific sentence that overstates is worse than a clumsy one that holds. When precision and warmth pull against each other, keep both and use two sentences.

Vocabulary · The words we own, the words we avoid, and the arguments we never open with

A category is won by whoever the market can quote. Describing a concept without naming it teaches the market someone else's vocabulary.

WORDS WE OWN · NAME THEM, DO NOT PARAPHRASE THEM

data sovereignty	Who the data belongs to, and who decides where it lives and who reaches it.
compliance	The conditions the customer sets and the network enforces. Always ours to define, never a synonym for certification.
architecture	Where the difference lives. The word that separates us from process and paperwork.

The rule. *In any text that explains what Iagon is, all three appear. In short forms, at least one. A headline, a caption, or a bio carries whichever one the piece is about.*

WORDS THAT CARRY THE ARGUMENT · USE WHERE RELEVANT

control · jurisdiction · auditable · verifiable · evidence · enterprise-grade · enforced · before · granted · independent

Two of these do more work than the rest. **Before** is the difference between compliance by design and compliance by process. **Granted** is the difference between a patent we hold and a patent we applied for. Neither ever gets cut for length.

WORDS WE AVOID

revolutionize · disrupt · pioneer	Outlaw and Ruler language. Sages explain, Caregivers protect. Neither disrupts anything.
game-changing · next-generation · cutting-edge	Adjectives that replace evidence. Every one of them is a claim with nothing behind it.
eliminates · guarantees · ensures · unhackable · 100% secure	Absolute promises. These are Never say lines in the Message Box, and they are the ones that cost us most if repeated.
seamless · effortless · at the click of a button	Consumer-ease language. It tells a regulated buyer we have not understood their problem.
leading · best-in-class · trusted by	Authority asserted rather than shown. Replace with the fact that would have earned the adjective.

ARGUMENTS WE DO NOT OPEN WITH

Price	Cheaper is a reason to switch, never a reason to trust. It arrives after the compliance argument or not at all.
The token	Answered plainly when asked. Never in the first line of enterprise, regulatory, or investor material.
Decentralization	How the promise is kept, not why anyone buys. An architectural fact inside the security pillar.
AI	Not a headline. Where it is part of the product, it is described by what it does.
The category name	Second, after the gap. A definition before a problem is something to evaluate, not something to care about.

TRANSLATE, DO NOT REPLACE

"You keep control" is a translation of data sovereignty for a lay reader. It is not a substitute for the term. Dropping the term to sound accessible means the reader learns the idea without learning the word, and the word is what they will search for later.

Data sovereignty means you decide where your data lives and who reaches it.

Mechanics · The small decisions that make separate documents look like one company

Nobody notices consistency. Everybody notices its absence, and reads it as carelessness. For a brand whose position rests on precision, that reading is expensive.

NAMES	
The company	Iagon. Capital I, lowercase rest, in every context including headlines and all-caps layouts. Never IAGON.
The category	The Shared Storage and Compute Economy. Capitalised as a proper name, lowercase article. We are naming a category we intend to own, and a lowercase category belongs to everyone.
Products	Iagon Storage. Iagon Compute. Iagon Insight. The company name carries, the function follows. Individual products may take their own names later; until then this pattern holds.

The token	IAG. No dollar sign in enterprise, regulatory, investor, or partner material. $IAG is permitted only in community and Cardano-native channels, where it is the local convention.
The chain	Cardano. Named as an architectural fact, never as an opening line in enterprise material.
Trademark	Iagon® on first mention in contracts, regulatory filings, press releases, and legal notices. Not in body copy, headlines, social posts, or presentations. The mark protects the name; repeating it in ordinary writing looks defensive.
NUMBERS	
Thousands	No separator. 2400 institutions. 15000 nodes.
Decimals	26.65 PB. 98.2M IAG.
Approximation	The plus sign carries it. 15+ jurisdictions, 50+ countries. Never "more than 15+".
Dates on figures	Every network figure carries figures as of 12 August 2026. Day, month written out, year.
Source	Iagon Ecosystem Stats App. The only name for it across the whole package.
Out loud	Spoken figures carry their date too. Numbers said on a panel get repeated by other people.
PUNCTUATION	
Long dash	Not used in English external copy. Full stops, commas, colons.

Oxford comma	Used. It removes ambiguity in lists of sectors and jurisdictions.
Colons	Introduce a list or a definition. One per paragraph at most.
Exclamation marks	Not used. Composure is a brand trait, and an exclamation mark contradicts it.
Quotation marks	Double quotes for quoted speech. Terms we own are named plainly, without quotes.
SPELLING	
The package	Current usage stands. New text follows the pattern already dominant in the surrounding document rather than switching mid-package.
Within a document	One spelling of a word. A page that says organisation in one paragraph and organization in the next reads as assembled by two people who did not talk.
STRUCTURE	
Paragraphs	Three to five sentences. A paragraph that runs longer is usually two paragraphs.
Headings	Sentence case. They describe what follows, not what it is about.
Lists	Used when items are genuinely parallel. Prose when they are not. A list of four unrelated things is a hidden paragraph.
Figures and diagrams	Every one carries a caption stating what it shows. A chart without a caption is decoration.
TERMS AND ABBREVIATIONS	
Not expanded	GDPR, HIPAA, API, CTO, RFP. The reader knows these.

Expanded on first use	PB (petabytes) in material for a non-technical reader. Any protocol term specific to us.
Never invented	We do not create acronyms for our own concepts. The Compliance Gap does not become TCG.

TWO RULES THAT LOOK SMALL AND ARE NOT

The dollar sign on the token is a signal, and it signals the wrong room. This mirrors the mascot rule in Brand Strategy: the same asset is right in one channel and wrong in another, along the same boundary.

The trademark symbol works the other way. It belongs where a legal reader expects it and nowhere else. A brand that marks its own name in a blog post is telling the reader it feels vulnerable.

The voice test · One question, three checks, and what to do when a draft does not pass

This block adds no rules. It is how the rules above get used on a Tuesday afternoon, on a draft that is due.

THE QUESTION

Does this sound like a trusted expert who cares about the people on the other side?

WHEN THE ANSWER IS "ALMOST"

Most drafts are not wrong. They are slightly off, and the writer cannot say why. Three checks, ten seconds each.

Can you name the pillar this serves?	If not, the problem is the message, not the voice. Go back to the Message Box.
Is one sentence written from the reader's side?	If not, we have slipped into pure Sage. Accurate, calm, and cold.
Does every verb survive its evidence?	If not, fix this first. It is the only failure here that cannot be undone later.

WHEN IT DOES NOT PASS

Sounds like a salesperson	Cut the adjectives. Replace each one with the fact that would have earned it.
Sounds like an academic	Name the person on the other side. A patient, an engineer, a compliance officer.
Sounds like a cheerleader	Add the evidence, and delete the sentence that was standing in for it.

Sounds like a warning	Check whether it still works on a reader who is not worried. If not, rewrite from what we build, not from what could go wrong.
Sounds like nothing at all	Remove every qualifier and see what is left standing. If nothing is, there was no claim to begin with.

WHO CHECKS, AND WHEN

The writer	Before showing the draft to anyone. Read it aloud once. Most failures are audible before they are visible.
The reviewer	Before publication. Name the pillar and the tone setting in the review, not just the corrections.
Under pressure	Always a second person, never the author alone. Under pressure the writer is the one who cannot hear their own tone.

ONE RULE ABOUT THE TEST ITSELF

A draft that passes the voice test and overstates a claim has not passed. Tone is the last check, never the deciding one. Nothing here overrides a Never say line.
